

City of La Porte Water Sources
7 ground water wells / Gulf Coast
Water Aquifer
City of Houston Southeast
Water Purification Plant / Trinity River

Contaminants may be found in drinking water that may cause taste, color, or odor problems. These types of problems are not necessarily causes for health concerns. For more information on taste, color, or odor of your drinking water, please contact the City of La Porte Public Works Department.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information on contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline. 1-800-426-4791

In the water loss audit submitted to the Texas Water Development Board for the time period Jan-Dec 2015, our system lost an estimated 15.5 percent. This accounts for leaks and unmetered uses. If you have any questions about the water loss audit please call (281) 471-9650. Please assist us by reporting all water leaks promptly!

La Porte City Council Meetings Second and Fourth Monday of each Month at 6:00 P.M.

En Espanol - Este reporte incluye la informacion importante sobre el agua para tomar. Para asistancia en Espanol, favor de lamar al telefono (281) 471-9650.

The TCEQ completed an assessment of your source waters and results indicate some of our sources are susceptible to certain contaminants. The sampling requirements for your water system is based on this susceptibility and previous sample data. Any detection of these contaminants will be found in this Water Quality Report. More information about source water assessment and protection efforts can be found at http://www.epa.gov/safewater/protect.html or contact the Public Works Department at (281) 471-9650 or www.laportetx.gov.

City of La Porte Water Quality Report for 2015

The City of La Porte's drinking water is monitored and tested in accordance with State and Federal regulations, and meets or exceeds all Texas Commission on Environmental Quality and Environmental Protection Agency requirements.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases radioactive material. It can also pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

Microbial Contaminants, such as viruses or bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic Contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.

Organic Contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, storm water, and septic systems.

Pesticides and Herbicides, which may come from a variety of sources, such as agriculture, urban storm water runoff and residential uses.

Radioactive Contaminants, which can be naturally-occurring or be the result of oil and gas production or mining activities.

DEFINITIONS

ppm - parts per million (equal to milligrams per liter)

ppb - parts per billion (equal to micrograms per liter)

pCi/l - picocuries per liter (a measure of radioactivity)

NTU - Nephelometric Turbidity Units (a measure of turbidity)

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Maximum Contaminant Level (MCL) - The highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLG's as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The level of a contaminant in drinking water below which there is no known or suspected risk to health. MCLG's allow for a margin of safety. **Action Level** - The concentration of a contaminant, which if exceeded, triggers treatment or other requirements which a water system must follow.

Coliform Bacteria - A group of bacteria found in the air, soil and in plants. Water of satisfactory bacteriological quality must be free of coliform organisms. Fecal coliform indicates a serious health concern since these are associated with sewage and animal wastes.

90th Percentile - A calculation method used to determine the 90% value in a range of sample results.

Special Notice for the Elderly, Infants, Cancer Patients, people with HIV/AIDS or other immune problems:

You may be more vulnerable than the general population to certain microbial contaminants, such as Cryptosporidium, in drinking water. Infants, some elderly, or immuno-compromised persons such as those undergoing chemotherapy for cancer; those who have undergone organ transplants; those who are undergoing treatment with steroids; and people with HIV/AIDS or other immune system disorders can be particularly at risk from infections. You should seek advice about drinking water from your physician or health care provider. Additional guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available from the Safe Drinking Water Hotline at (800) 426-4791.

The table on the reverse side will show the amounts in which some contaminants were found in the drinking water. No maximum contaminant level was exceeded and there were no violations of drinking water standards. All data presented is from the most recent testing done in accordance with the regulations.

City of La Porte Water Quality Report for 2015

organics Year	Constituent	Highest Level at any	Range of Detected	MCL	MCLG	Unit of	Possible Source of
ा स्था	Consuluent	Sampling Point	Levels	IVICL	IVICEG	Measure	Constituent
